

contentteam is one of the first integration service providers in Germany which offers Documentum and SharePoint solutions on a Cloud Computing basis. Take advantage of potentially high savings!

Begin your journey into the Cloud with us

Sunny expectations for Clouds

Private consumers use web mail, administrate their appointment calendar entries online, store documents, personal photographs and videos on the web and secure their data on external servers. For many, these kind of online applications are now customary. The providers of these services very often rely on Cloud Computing and are therefore able to offer adequate computing power, data storage and software solutions via the internet.

Even in the commercial and industrial sector, Cloud Computing is becoming an important alternative to conventional infrastructure models. Providers such as Microsoft, Amazon or EMC offer infrastructure to several companies simultaneously and rent out the servers in a Cloud setting. The deployment of solutions is based on an all automatic combination of virtualised data centres and modern web technology. It is possible to dynamically adapt each the computer, the storage, the network, the operating system and the applications to your business processes. As the consumers are only accountable for the infrastructure actually used, you save costs.

In the future, almost no company will be able to afford to ignore this technological development. The IT sector is already preparing itself for this. According to a study by IDC, the worldwide Cloud business is expected to grow from 16 billion dollars in 2009 to almost 56 billion dollars in 2014.

Is ECM still useful in an owner operated municipal enterprise?

A comprehensive investigation, assessing whether the integration of Cloud technology into content management solutions, document management systems and collaboration solutions would be of benefit, is also being recommended. Enterprises that settle for this change will no longer have to operate and provide the IT landscape along with its computer centre, data storage and enterprise content management applications. Instead, they will lease the required infrastructure from the respective providers. This approach extends far beyond the classic hosting model: The combination of virtualised data centres and modern web technology enable each of the systems to be adapted to your business processes.

The contentteam integration experts have been dealing with Documentum and SharePoint solutions from a very early stage. The managing director Reza Piroozram concludes: "Cost and efficiency differences are the indications that mostly argue for a development of Documentum and SharePoint solutions on the basis of Clouds. Hardware costs are reduced by 40 to 75 percent."

With Cloud providers such as Microsoft or Amazon and integration partners such as Cloud Angels, contentteam is able to develop complex solutions within just a few weeks.

Your advantages with Cloud Computing

Cost effective

contentteam are now able to supply you with individual ECM solutions, without you having to invest in the infrastructure in advance. The consumption based payment models used by the Cloud providers only charge for the time actually spent on the servers.

Availability, scalability and flexibility

Dependant on your needs, the ability to add or remove memory and server power is virtually unlimited.

Performance and internationalisation

The Cloud provider computer centres are located all over the world. This gives you the potential to allow access to your ECM applications from different locations worldwide and it also ensures the consumers high performance due to a backup server.

Speed of implementation

Together with the partner Cloud Angels, contentteam is able to supply you with the necessary infrastructure at the flick of a switch and is also able to customise it to your individual requirements. Based on this concept, the experts are able to design complex ECM solutions for you within a few weeks.

Prevention of additional maintenance

You will require less high maintenance server, storage and infrastructure components.

More focus on the core business

All this makes it easier for you to concentrate fully on your core business. contentteam will assist you by providing custom ECM solutions and also by supplying all the necessary infrastructure services.

Expected Demand for Infrastructure

Clouds are of a dynamic nature

You know the problem: Before choosing the server features for an ECM application you have to predict the performance requirements needed over a specific period of time (diagram). Usually, you will only be able to create a rough estimate of which hardware capacities will be required. By no means do you want your future consumers to be put off by low performance, but at the same time you don't want to waste your budget. By being able to adapt the processing performance based on your needs, the Cloud based solutions can intercept the application apex very promptly.

We look forward to hearing from you!

Would you like to know more about the Cloud approach? Do not hesitate to contact us! We would be delighted to help.
